SALES PERFORMANCE DASHBOARD REPORT AND WORKFLOW

Actionable Insights

The Power BI Sales Performance Dashboard helps identify sales and profitability patterns across categories, regions, customer segments, and months.

1. **Overall Performance:** The dashboard displays Total Sales, Total Profit, Total Orders, Average Order Value, and Profit Margin to monitor business performance.
2. **Category Performance:** The Sales by Category chart helps identify categories with higher and lower sales. The business can focus on high-performing categories and investigate low-performing ones.
3. **Regional Performance:** The Sales by Region chart helps compare regional sales and identify regions that may need additional marketing or sales support.
4. **Monthly Trends:** The Monthly Sales Trend chart helps identify months with higher or lower sales. This information can support future sales planning and promotional activities.
5. **Customer Segments:** The Sales by Segment chart helps compare sales contributions from different customer segments and plan targeted marketing strategies.

Recommendation: Management can use the dashboard to monitor performance regularly, investigate low-performing areas, and make data-driven business decisions.

Project Workflow

Step 1: Data Collection

The Sample Superstore dataset was used for sales performance analysis. It contains information about orders, sales, profit, products, categories, regions, and customer segments.

Step 2: Data Preparation

The dataset was loaded into Microsoft Power BI. The data and column types were reviewed, and the required fields were prepared for analysis. A Calendar table was created to support date-based analysis.

Step 3: Data Modeling

A relationship was created between the Calendar table and the Order Date column in the sales dataset.

Step 4: DAX Measures

The following measures were created:

- Total Sales
- Total Profit
- Total Orders
- Average Order Value
- Profit Margin %

Step 5: Dashboard Development

KPI cards, a category sales chart, a regional sales chart, a monthly sales trend line chart, a segment donut chart, and Region, Category, and Segment slicers were added.

Step 6: Dashboard Design

A consistent layout, light-blue background, white visual backgrounds, and clear titles were used to improve readability.

Testing and Validation

The following tests should be performed before submission:

Test	Expected result
Total Sales KPI	Displays the total sales value
Total Profit KPI	Displays the total profit value
Total Orders KPI	Counts distinct Order IDs
Average Order Value	Total Sales divided by Total Orders
Profit Margin	Total Profit divided by Total Sales
Region, Category and Segment slicers	Apply the configured filter interactions

Monthly Sales Trend	Displays months in chronological order
Dashboard refresh	Visuals update after a successful data refresh

Testing Result: Complete these checks in Power BI and record each as Pass or Fail. Correct any issues found before submitting the project.

Conclusion

The Sales Performance Dashboard was developed using Microsoft Power BI, Power Query, and DAX. It provides a consolidated view of sales performance through KPIs, charts, and filters. The dashboard supports the analysis of sales trends, category performance, regional performance, and customer segments, helping users make informed business decisions.
